

NORTHWEST WEIGHT AUGERBAGGER

FOR THE SMALLEST OR THE LARGEST GROWER . . . REPACKER . . . OR STORE

ACCURACY

The singling augers feed the last two or three items of produce individually onto the weighing plate. Each piece is the same distance apart on the augers so that weight controls can automatically turn off the augers with an exactness of one piece. Since you cannot add a fraction of an apple or potato it is possible for the augers to stop feeding with the load slightly underweight. In this event the weighing plate is automatically blocked and will not dump a "shortweight".

GENTLENESS

Each piece moves individually along the length of the augers directly onto the weighing plate. The weighing plate is set at a slight angle to receive produce. When the pre-set weight is reached, the weighing plate tilts and deposits the produce into the bag. Essentially the produce is rolled through each operation thereby eliminating the shake, drop and bump of hand operated chutes.

A 'Mac-Head' lowering apron is adaptable to the augerbagger for apple packing.

ADAPTABILITY

Northwest Weight Augerbaggars are adaptable to most standard produce bagging equipment . . . they are designed to pack by weight, onions, apples, citrus fruits and most types of potatoes plus other types of essentially spherical produce items. Because of its speed the Augerbagger can be readily adapted to automatic polyethylene or plastic mesh bag dispensing machines.

COSTS

Northwest Weight Augerbaggars cost much less than standard double head autobaggars yet more than double their production. Once again Northwest "sets the pace" for efficient low cost bagging equipment.
